To watch practical demonstration videos, or to download an electronic copy of these instructions, please visit <a href="www.picotesolutions.com">www.picotesolutions.com</a>. Please note that videos are not intended as a replacement or alternative to this operating and safety manual, but only as an additional learning tool.

Step 1. Detach the shaft from the Miller and its reel. Use a Hex Key 4mm to loosen two Hex Socket Set Screws (DIN916 M8), so that you can remove the shaft from the Shaft Socket. Use a smooth jaw adjustable wrench 20mm to disconnect the Shaft Socket from the Motor. At the same time, you have to press the black button behind the Motor to lock the Motor Axle.

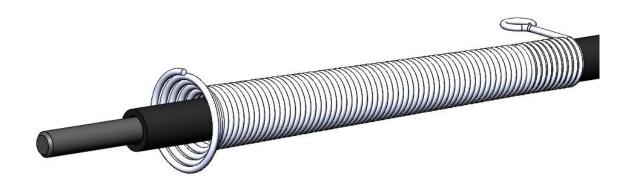

Step 2. Connect the Safety Clutch to the Motor When tightening it, press the Motor's locking button behind the Drill/Motor. Tightening can be done manually.

Step 3. Push the Shaft end back under the Miller's Reel Plate and add the Strain Relief Spring onto the Outer Casing. Push and manually rotate clockwise at the same time.

Step 4. The Outer Casing have to come through the Strain Relief Spring. This is really important part of STEP 5.

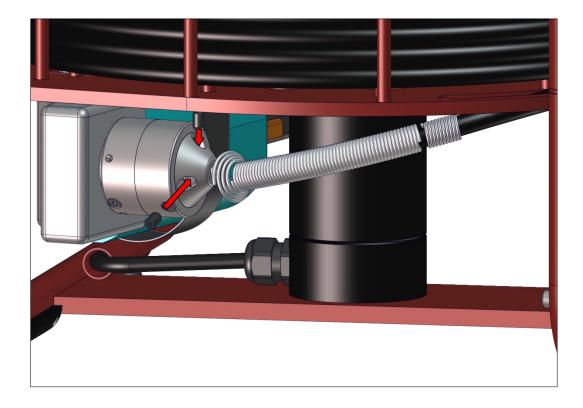

Step 5. The Strain Relief Spring is correctly installed when the Outer Casing comes outside of the cone so that there is only a small gap between the Safety Clutch and the Outer

Casing.

Step 6. Connect the Shaft to the Safety Clutch and tighten the Hex Socket Set Screws (2pcs) with a Hex Key 4mm. The Outer casing should almost touch the Safety Clutch, bare cable is always weak and therefore can twist.

Step 7. Correctly installed Safety Clutch.

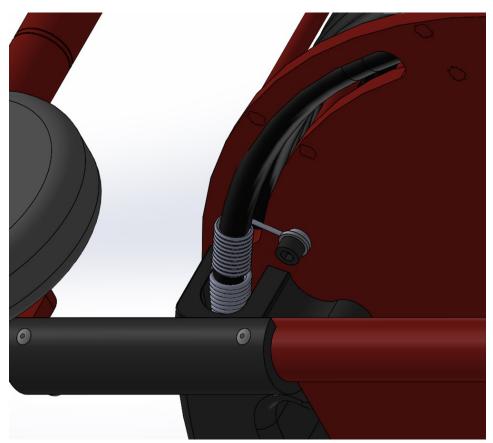

Step 8. Add the Hand Guard and tighten it with two M10x25mm bolts. Use a Hex Key 6mm.

Step 9. During the final step, drill a 6.5mm/1/4" hole for the Strain Relief Lock so you can get the M6x25mm Bolt through the Miller's Reel Plate.

Step 10. Put the Bolt through the Strain Relief`s Locking Ring and the Miller's Reel Plate and tighten it using a Hex Key 5mm and a smooth jaw adjustable wrench 10mm.
